The challenge

Why this is a Big Data problem

Volume

1M+ rows
Too large for
spreadsheets or
standard BI tools;

Velocity

Daily
Transactions flow in
continuously,
decisions can't wait;

Variety

8 fields
Products, customers,
geographies,
timestamps
combined;

Veracity

**26K duplicate
rows**
Duplicates and
missing IDs found;

Insight 1 - Revenue

Revenue is concentrated

⦿ **€17.4M**

Total revenue (2 years)

⦿ **€580K**

Single top customer

⦿ **€352K**

Average spending of the top 4 accounts

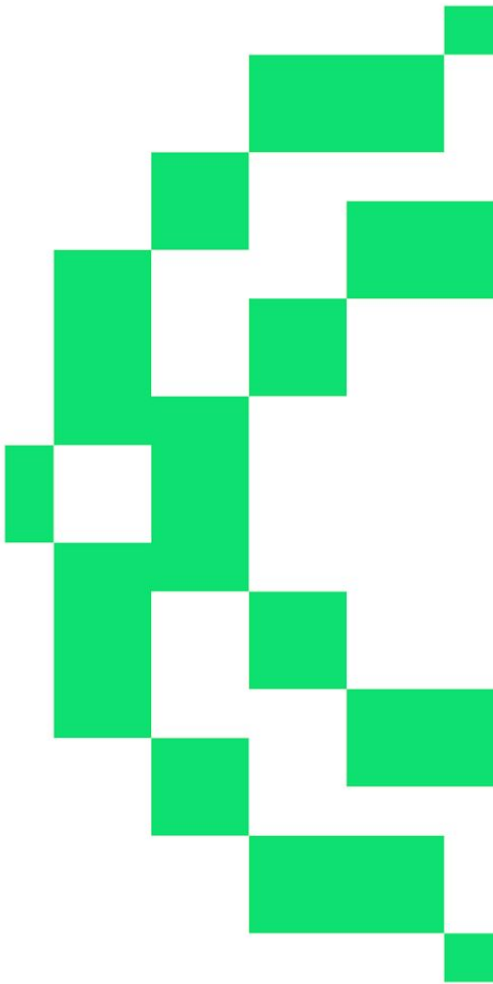

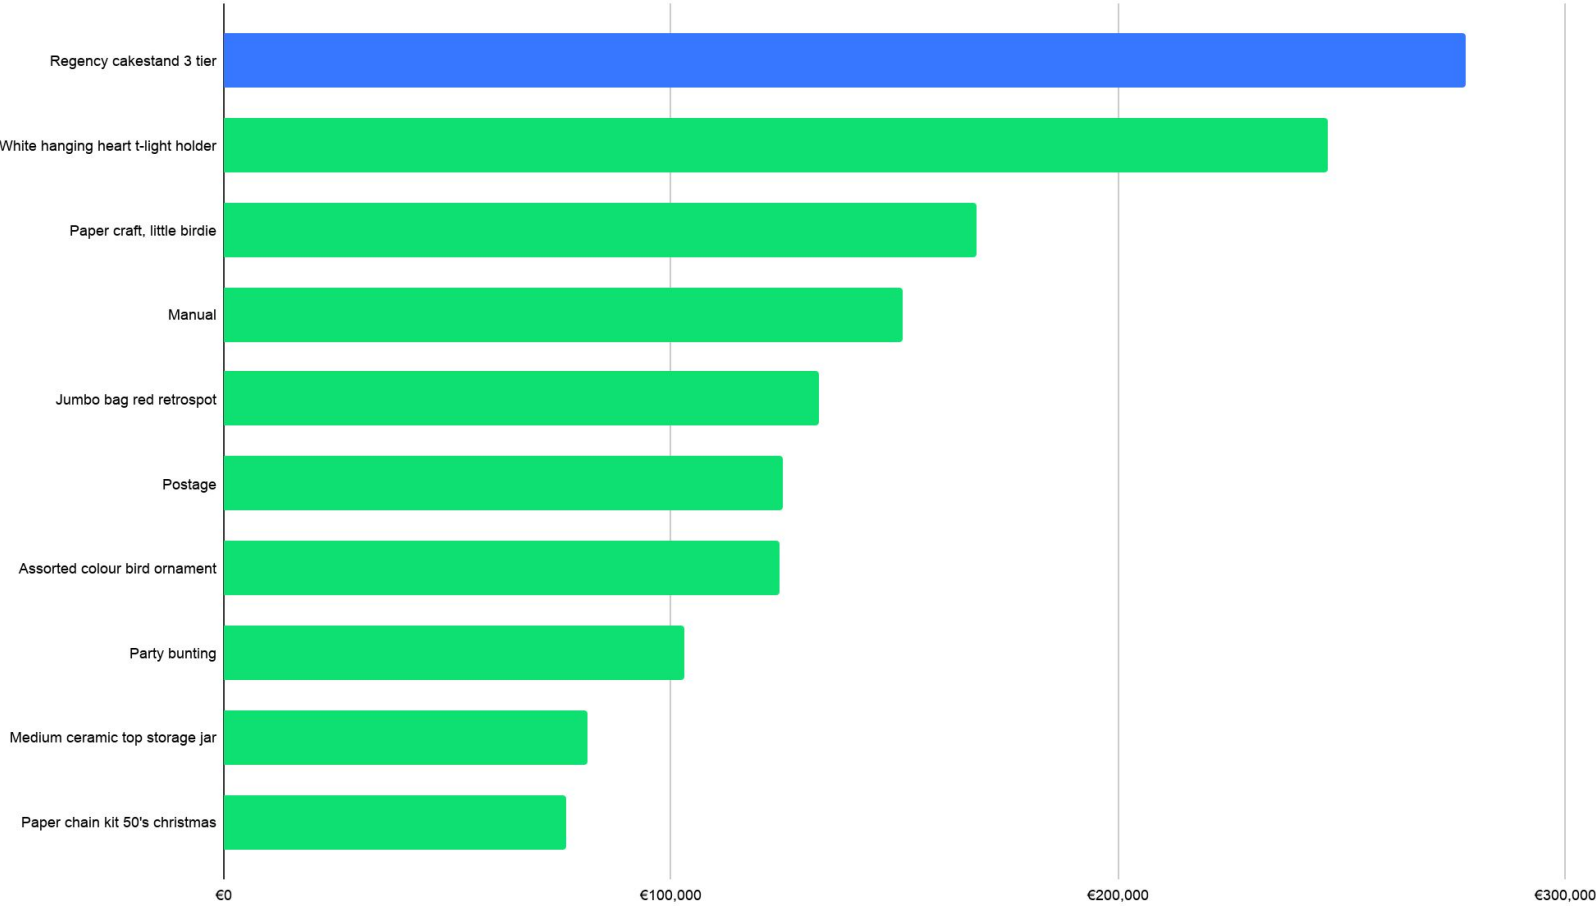

50.2%

of total revenue
comes from just **261 customers (4,9%)**
out of 5281 total

Top 10 products by revenue

Revenue Concentration: Top 2 Products Drive Global Turnover

Top 10 products by revenue (€)

Insight 2 - Segmentation

Not all customers are equal. There are 4 distinct segments

Loyal Customers

Customers: 3046
Avg spend: €2.827,36

Last purchase: 80 days ago on average
Represent the solid and regular base of the business. Although they do not buy with extreme frequency, they have a very healthy accumulated spend and return with some regularity

Hibernating

Customers: 2196
Avg spend: €777,79

Last purchase: 388 days ago on average
Customers who generated low value, purchased very few times, and have not interacted with the brand for a long time, running a severe risk of churn

Champions

Customers: 4
Avg spend: €352.002,34

Last purchase: 4 days ago on average

- Most valuable and vital customers.
- They feature an extraordinary billing value and hyper-frequent purchases.

High value

Customers: 35
Avg spend: €62.924,90

Last purchase: 24.3 days ago on average

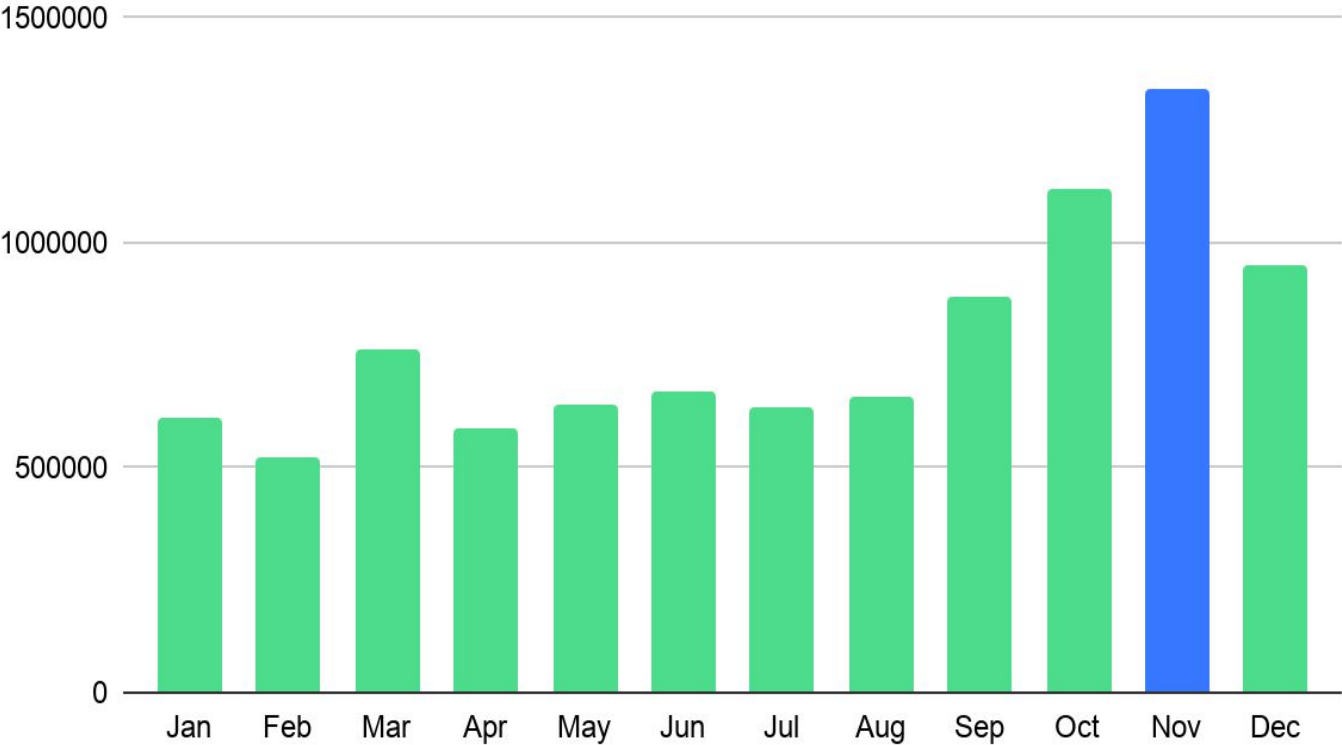

- Exceptional customers who buy frequently, spend considerable amounts, and were active very recently.
- Ideal targets for VIP loyalty programs and early product launches.

Churn prediction model: 79% accuracy (AUC 0.79). Recency is the #1 predictor of customer loss.

Insight 3 - When and where

Marketing efforts

Monthly revenue — all segments (£)

€14.4M

United Kingdom
83% of total revenue

€617K

Ireland
Only 5 clients. B2B opportunity due to high revenue per client

€554K

Netherlands
High revenue / low customer count. Strong core of clients.

€425K

Germany
Largest international market by volume. Opportunity for localised marketing campaigns.

3 actions the client can take now

01

Protect the 261

Assign dedicated account management to customers generating over €10,000. Half the business depends on them.

02

Activate churn prevention

When recency spikes above threshold, trigger an automated discount or re-engagement campaign. The model is already built.

03

Time campaigns for Q4

Every segment peaks in October–November. Budget and creative should be concentrated here, not spread evenly across the year.

Audience concentration, status bias and content safety

Massive but Skewed Network

Users: 168,114

Connections: 6.8M

Median Views: 4,117 (Max: 384M)

Highly skewed network. Focus major budgets on the top 3,410 tier (1M+ views) for mass reach. Use mid-tier (10K–100K) for cost-efficient, highly engaged niche audiences

Affiliate Status vs Reach

Avg Views: 343,477

vs. Affiliates: 23,281

Reach Factor: ~15x Higher

The affiliate badge does not guarantee reach; mega-streamers have outgrown the program. Ignore status badges and select partners strictly based on raw view counts and engagement

Safe content rules the audience

Avg Views: 254,116

vs. Mature: 113,822

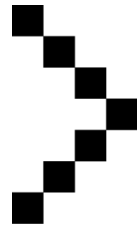

Audience Size: Nearly Double

Family-friendly and non-mature channels attract significantly larger crowds. Prioritize and filter for non-mature content to maximize audience scale while securing strict brand safety

Conclusion

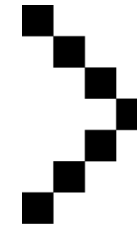

What we found

- 261 customers makes for 50.2% of income
- 56.6% of the customer base has already churned
- Recency is the dominant signal

What we built

- 4-segment RFM model, deployable today
- Churn predictor at AUC 0.79
- Seasonal campaign calendar, segment-specific

What comes next

- Automated churn trigger with discount or re-engagement
- Segment-personalised campaigns
- CLV forecasting: Predict next 12 months of revenue per customer

Thank you!
